

Insight

GREEN TECH

Green tech is technology designed to improve the state of the environment, by mitigating the negative effects of human society on the planet, or actively reversing those effects.

There are many fields within this category. For example, companies working within the circular economy look to design systems where waste products can be repurposed, effectively creating a closed (or mostly) closed loop of sustainable technology that minimizes waste and pollution.

Speaking of sustainability, Jakarta Land has been putting some efforts to support green initiative such as energy efficiency, waste management, improving indoor air quality, using sustainable materials, and providing electronic vehicle charging within the Complex.

Find out more about green technology and how you can apply it at home and at work to create a greener environment by signing up to our upcoming Community Gathering. Details can be found on the side poster.

Yours truly,

the community editor
